

MAQS[®]imising Your Economic Return: UK

Good Nutrition + MAQS = Healthy Bees

Colonies should have good food reserves prior to treating with MAQS[®].

MAQS[®] is an **Acute effect only**, 7-day treatment for varroosis.
Full benefits are realized only after a full brood cycle of healthy bees are raised.

For Honey: Maximize healthy colony populations by treating with MAQS[®] 4 to 6 weeks before main honey flows. **Have a super on.**

For Overwintering: Treat at end of the honey flow, preferably while the last super is still on.

Before Splitting: Treat 2 to 4 weeks before.

Temperature: Less than 29.5°C on day of application

Ventilation: Full width of Hive, minimum 1.3 cm high.
Colonies should have **good food reserves** .

Do not destroy queen cells/virgins that may be seen before or after treatment, colonies may be going through supercedure.

Mother/daughter queens both present is not uncommon.
